haiyangy@andrew.cmu.edu

+1-408-839-3245

Cupertino, CA

## EDUCATION

---

- **Carnegie Mellon University Silicon Valley** Mountain View  
*Master of Science in Software Engineering* Jan. 2018 – May. 2019
- **Nanyang Technological University** Singapore  
*Bachelor of Engineering, Electrical and Electronic Engineering; GPA: 4.61/5.0* Aug. 2010 – May. 2014
- **Courses:** Foundations of Computer Systems, Data Structure and Algorithm, Practical Data Science, Foundations of Software Engineering

## TECHNICAL SKILLS

---

- **Languages:** JavaScript, Java, Python, C, Shell, HTML, SQL
- **Technologies:** Angular, React, Redux, Express.js, MongoDB, Node.js, Tornado, Android, Gradle, Linux

## PROJECTS

---

- **Emergency Social Network (HTML, JavaScript):** Developed a chat application designed for times of disaster that provides functions including public chat, private chat, post announcement, share status, user administration and emergency contacts. Used **Angular** and **Angular Material** for frontend, **Express.js** and **Node.js** for backend, **MongoDB** for database.
- **Online Bulletin Board (React, Redux, Tornado):** Implemented post sorting by tag and post searching features using **React**, **Redux** and **Tornado**.
- **Movie Box Office Prediction (Python):** Crawled raw html of over 8,000 movies from Box Office Mojo and parsed them into meaningful data using **lxml**. Processed 30 million pieces of movie information using **MapReduce**. Extracted features using **Pandas**, **NumPy** and **One Hot Encoding**. Trained 2 prediction models using **Linear Regression** and **Decision Tree Regression**. Compared their accuracy based on **mean squared error**.
- **Malloc (C):** Independently implemented a **dynamic memory allocator** using **segregated free list** that achieved 74.1% memory utilization and 20,000 throughput.

## WORK EXPERIENCE

---

- **Moqi.ai (Java, Shell)** Beijing, China  
*Software Engineer Intern* May 2018 - Aug 2018  
Designed and implemented fingerprint system fault tolerance that improved system uptime from 93% to 99%
  - **Ceph Filesystem:** Set up **Ceph Filesystem** with **Erasure Coding** as main distributed storage for segments cached in matching servers' memory.
  - **Fingerprint System Docker Compose:** Simplified fingerprint system testing through creating **docker compose** file to run the entire fingerprint system on a single server. The fingerprint system consists of heterogeneous **gRPC** services written in Java, Python, C++ as well as Redis, Cassandra and SeaweedFS.
  - **Matching Server Fault Tolerance:** Designed and implemented auto discovery of online/offline **dockerized** matching servers through **Consul** and **Registrator**, which triggers segment redistribution among matching servers and segment recovery from Ceph Filesystem.
  - **Controller Fault Tolerance:** Designed and implemented Controller **Active/Standby Failover** through **Consul's Leader Election**.
- **Barclays Capital Services (Java)** Singapore  
*Software Engineer* Jun 2014 - Dec 2017
  - **Trade Reporting Processor:** Developed Trade Reporting Processor that retrieves and applies trade reporting obligations. Implemented caching of index constituents using **Google Guava** that cut down query time by 50%.
  - **Market Object and Static Services:** Developed a greenfield market data calculation application which used **Redis** for caching, **Elasticsearch** for logging and **Akka** for concurrency.
  - **Sparta Automatic Deployment:** Fully automated Sparta deployment to 24 servers across 5 countries that used to be manual and sluggish. This consisted of migrating Sparta from **Perforce** to **Git** version control system, and implementing continuous deployment through **TeamCity** and **Nolio**.
